

# Corrosion-resistant energy management for data center racks

## Overview

This Best Practices Guide has been created to provide viable alternatives to inefficient data center building practices. This guide provides an overview of best practices for energy-efficient data center design which spans the categories of information technology (IT) systems and their environmental conditions, data center air management, cooling and electrical systems, and heat recovery. IT system energy efficiency. Arkema delivers high-performance materials to ensure long-term reliability, signal integrity, and fire safety in modern data centers. From PCB protection with conformal coatings and encapsulants to precision bonding and optical fiber coatings for high-speed data transmission, our solutions optimize. Corrosion: Although steel can be treated to resist corrosion, it remains susceptible over time, particularly in environments with high humidity or exposure to corrosive substances. Heat. As AI data centers exceed 100 kW per rack they producing heat loads rivaling dozens of household ovens in a single cabinet. No wonder cooling systems are working harder than ever. While everyone focuses on computational power, energy efficiency, and keeping servers cool, corrosion quietly erodes. Eaton's industry-leading thermal management solutions, coupled with its broad range of server and network racks, enclosures and cable management, help customers meet evolving technology requirements and optimize data center airflow. Liquids require 10 to 20 times less energy to transport energy.
