

Distributed energy storage power generation efficiency

Overview

This paper presents a novel optimization framework for integrating, sizing, and siting distributed renewable generation and energy storage systems in power distribution networks. Distributed generation (DG) in the residential and commercial buildings sectors and in the industrial sector refers to onsite, behind-the-meter energy generation. DG often includes electricity from renewable energy systems such as solar photovoltaics (PV) and small wind turbines, as well as battery. Energy storage systems (ESS) play a crucial role in achieving these objectives, particularly in enabling effective islanding operations during emergencies. This research leverages genetic algorithms to identify optimal combinations of ESS units and strategic load curtailment techniques to mitigate. DERs are small modular energy generators that can provide an alternative to traditional large-scale generation. DERs can improve energy reliability and resilience by decentralizing the grid.
