

How many inverters can the grid-connected cabinet connect to

Overview

The grid-tied ESS supports a maximum of three SUN2000- (2KTL-6KTL)-L1 inverters (with batteries) cascaded. In this scenario, the inverters can be connected to the grid only at the same phase and controlled only by a single-phase power meter. All slave inverter put to separate hot leg. In other words, in a quad stack, inverter 1 and 2 are on leg. When the SUN2000- (12K-25K)-MB0 series inverters are used in the SmartLogger3000 networking scenario, a maximum of three inverters can be cascaded, and each inverter can connect to a maximum of four ESSs. Historically, electrical power has been predominantly generated by burning a fuel and creating steam, which then spins a turbine generator. If not, do you have each inverter tied to a battery cabinet, or a "primary" inverter that connects to the batteries and the second inverter grid tied?

Thanks! I can't answer that. I only know from what my Generac installer said.
