

Method for measuring resistance of new energy battery cabinet

Overview

The internal resistance is measured with the international standard AC signal ($1000\text{Hz} \pm 10\%$) by means of four-wire method to eliminate the impact of the resistance of the test leads on the measured value, and the battery voltage can also be measured by the same connection method. This article proposes a new method to assess a battery's health by measuring the battery's internal resistance, based on the measurement of its voltage ripple in response to the current ripple imposed by the charger which in most UPS applications is permanently connected to the battery. What is the yr1035+ battery internal. Internal resistance testing is carried out at each process after battery cells are filled with electrolyte and their assembly completed (charge/discharge testing, aging testing, shipping inspections, etc. DCIR represents the total internal impedance of a battery, which includes ohmic resistance and polarization.
