

Mexican energy storage peak-shaving power station

Overview

Therefore, this paper proposes a coordinated variable-power control strategy for multiple battery energy storage stations (BESSs), improving the performance of peak shaving. The Ministry of Environment and Natural Resources (Semarnat) last week conditionally authorised the. To address this problem, there has been an exponential growth worldwide in the installation and use of energy storage technologies aimed at: (1) reducing costs in production processes by consuming electricity in the most economical periods; and (2) allowing an increasing reliance on renewable. Amid these pressing challenges, the concept of peak shaving emerges as a promising strategy, particularly when harnessed through battery energy storage systems (BESSs, Figure 1). These facilities store energy when demand and. In order to achieve the goals of carbon neutrality, large-scale storage of renewable energy sources has been integrated into the power grid. In Mexico, the CFE has identified that the average time of highest network usage is concentrated between 6pm and 10 pm.
