

Strategy for opening explosion-proof fans in energy storage cabinet

Overview

A protection strategy using Gas Detection with Emergency Ventilation along with Passive or Active Protection will increase the overall safety of the protection system. Scientists at the Pacific Northwest National Laboratory developed this patent-pending deflagration prevention system for cabinet-style battery enclosures. Intellivent is designed to intelligently open cabinet doors to vent the cabinet interior at the first sign of explosion risk. This functionality. Both the exhaust ventilation requirements and the explosion control requirements in NFPA 855, Standard for Stationary Energy Storage Systems, are designed to mitigate hazards associated with the release of flammable gases in battery rooms, ESS cabinets, and ESS walk-in units. At CLOU, we deeply respond to customers' safety needs. The BES standards recommended by NFPA 855 and 68, EN 14491, and EN typical Installation performance depends upon appropriate mounting to the BESS.
