

The difference between sodium-ion batteries and lithium batteries for energy storage

Overview

Lithium-ion technology will continue to dominate where power density and compactness are key, while sodium-ion batteries will lead in grid-scale and residential storage, where safety and affordability matter most. A sodium-ion battery is a rechargeable energy storage device that uses sodium ions (Na^+) to transfer charge between electrodes. Structurally, it closely resembles a lithium-ion battery, consisting of three primary components: a cathode, an anode, and an electrolyte. 1 million in 2024, are expected to grow at a 26. 1% CAGR, driven by their affordability and suitability for stationary storage. Here is our practical breakdown of the. Compared with lithium-ion batteries, sodium-ion batteries perform more reliably across extreme temperatures, typically from $-30\text{ }^{\circ}\text{C}$ to $+60\text{ }^{\circ}\text{C}$. This makes them suitable for harsh climates or remote areas where environmental control is limited. How Do Sodium-Ion Batteries Compare to Lithium-Ion for Grid Storage Applications?
