

The external power supply should turn on the dc

Overview

" If you are working with a circuit that will be connected to an external power supply, turn the power switch of the external supply OFF before you begin work on the circuit. Most electronic circuits require a DC power supply. Chances are you have one at home already, and can use it for physical computing projects. The most common operating voltages for microcontrollers and digital processors are 5V and. Cause - Improper plug-in procedure and/or the DC-In pins of the External Power Supply have become recessed 1. These power supplies come. Thus, a DC power supply is essential for converting that energy to power your electronic devices - from tablets to TVs, microwaves to blow dryers. Do your power supplies and the Arduino have a common GND connection ?
