

Thin Film Solar System

Overview

Thin-film solar panels use a 2nd generation technology varying from the crystalline silicon (c-Si) modules, which is the most popular technology. Thin-film solar cells (TFSC) are manufactured using a single or multiple layers of PV elements over a surface comprised of a variety of glass. There are several types of materials used to manufacture thin-film solar cells. In this section, we explain the different types of thin-film solar panels regarding the materials used for the cells. Thin-film solar panels have many interesting applications, and they have been growing in the last decade. Below you will find some of the most popular applications for thin-film. Before comparing the different types of thin-film solar panels against crystalline silicon solar panels (c-Si), it is important to remark that there are two main types, monocrystalline. Thin-film solar panels have many pros, while only holding a few cons to them. These are the most important pros and cons of this technology.
